

Ground Investigation

Why Undertake Ground Investigation?

Ground investigation is undertaken at the start of a project to assess the condition of the soil, the underlying groundwater and the geological conditions of a site.

By its very nature, ground investigation only samples a very small amount of the soil, or water on any site. Thus it is possible that pockets of contamination and changes in ground conditions lie between the points tested. This is where the skill of experienced consultants is needed in order to minimise the risk as much as possible.

REC uses a wide range of sampling and analysis techniques in its ground investigation work.

Borehole Development

A borehole is an exploratory hole drilled into the soil and rock to gather physical data. Both water samples and gas samples can be taken out of boreholes. Often boreholes are left in place after construction in order to allow continued gas/groundwater sampling.

Shell and Auger Boring

This technique involves using a cable percussion driven tool to collect samples. The technique is especially useful where space is an issue and is generally used in the investigation of softer ground. The technique is particularly useful because it allows the maximum amount of information to be obtained from the soil sample.

Rotary Auger Boring

In this type of borehole a rotary auger collects the sample with a central core for sample collection built in to the drill. This type of boring is particularly useful when hard ground conditions are encountered.

Rotary Coring

When an assessment of the strength of the rock or when assessing the distribution of lithologies it is necessary to retrieve samples of rock. Rock mechanics requires the retrieval of undisturbed samples for physical laboratory testing. Therefore REC is acutely aware of the need for high quality data.

Trial Pitting

This is a rapid and inexpensive method of examining the soil on a site. The process usually involves digging a trench with an excavator in order to allow sampling of the revealed soil. Trial pitting has its limitations in that soil can only be sampled to the reach of the excavator and the soil obtained is highly disturbed.

Window Sampling

Window sampling is a cost effective technique that is routinely used to provide an assessment of ground conditions within superficial materials. Window sampling allows for the drilling of boreholes to a shallow depth (normally <10mbgl), retrieval of samples (undisturbed and disturbed) and the installation of groundwater/ ground-gas pipe work and infrastructure.

Soil Vapour Surveys

Soil vapour surveys are used to investigate whether vapours such as landfill gas, petroleum hydrocarbons and solvents are being generated by the soil. These types of surveys are usually carried out on site using direct reading instrumentation, however REC can, through its UKAS accredited sister laboratory company, also obtain speciated analyses of vapours from the soil.

Soil and Groundwater Collection

REC collects soil samples for chemical analysis to determine the presence of any contamination. The method of soil sampling varies depending on the soil type, and the contaminants being tested. Most chemicals can be sampled from disturbed soil, as would be the case in trial pitting. When undisturbed samples are required, sampling tubes can be used to keep the soil in its original condition.

Water samples are often collected from boreholes and surface water for chemical analysis. These samples are analysed for possible contaminants, using knowledge gained about the site's historic use.

Analysis and Interpretation

The data obtained from the sampling and analysis is used for comparison with published values such as the CLEA guidelines. Expert interpretation of the data then provides an accurate picture of the ground conditions.

REC Office Locations

Manchester:

Osprey House, Pacific Quay, Broadway, Manchester M50 2UE
Tel 0161 868 1300, Fax 0161 868 1301

Birmingham:

Unit 19 Bordesley Trading Est, Bordesley Green Rd, Birmingham B8 1BZ
Tel: 0121 326 7007, Fax: 0121 328 1689

Glasgow:

11 Law Place, Nerston Mains, East Kilbride G74 4QL
Tel: 01355 574 160, Fax: 01355 574161

Edinburgh:

Suite 13 Bilston Glen Enterprise Centre, Dryden Rd, Loanhead, Edinburgh, EH20 9LZ
Tel: 0131 440 4562, Fax: 0131 440 3841

Braintree:

3 Crittall Drive, Springwood Industrial Estate, Braintree, Essex, CM7 3RT
Tel: 01376 554400, Fax: 01376 528980

Fareham:

REC House, Segensworth Business Centre, Segensworth Rd, Fareham, Hampshire
PO15 5RQ
Tel: 01329 846824, Fax: 01329 845439

Port Talbot

Unit 19 Kenfig Industrial Estate, Margam, Port Talbot, SA13 2PE
Tel: 01656 749823, Fax: 01656 740824

Huddersfield:

Ellerslie House, Queens Rd, Edgerton, Huddersfield, HD2 2AG
Tel: 01484 428274, Fax: 01484 428276

Dundee:

Unit 1.7 Discovery House, Gemini Crescent, Dundee, DD2 1SW
Tel: 01382 561985, Fax: 01382 562839

Newcastle:

Metropolitan House, Longrigg Rd, Swalwell, Gateshead, NE16 3AS
Tel: 0191 495 6243, Fax: 0191 495 6160

N Ireland:

69A Killyman Street, Moy, Co. Tyrone, BT71 7EA
Tel: 028 8778 9599, Fax: 028 8778 9552

REC Group Services include: ■ Geo-environmental Site Investigation & Risk Assessment, ■ Brownfield Site Remediation, ■ Ecological Surveys ■ Asbestos Surveys, Analysis & Clearance Certification ■ MCERTS accredited Stack Emission Monitoring ■ Air Quality & Odour Monitoring & Assessment ■ COSHH Monitoring Assessments ■ UKAS & MCERTS Accredited Laboratory Analysis

UK Offices in Manchester, Birmingham, Braintree, Fareham, Huddersfield, Newcastle, Port Talbot
East Kilbride, Edinburgh, Dundee and N Ireland

REC Ltd Registered Office: Hadfield House, Hadfield Street, Old Trafford Manchester, M16 9FE
